Supplementary figure 1: Forskolin responses during Ussing chamber experiments. The change in I_{sc} was evaluated 15 min after the addition of forskolin on the serosal side of a segment of distal colon (A, D), proximal colon (B, E) or terminal ileum (C, F). Analysis using an independent samples *t*-test with Welch's correction for unequal variances (D) or Mann-Whitney U test (A-C, E, F) for $n = 9 - 10$ animals/group did not reveal significant differences between the treatment groups. I_{sc} , short-circuit current.
